Background

We are an organization of car owners located in Sweden with approximately 250,000 members. With most members possessing more than one car, it has become difficult to find a market to sell cars. Another challenge includes both members of the organization and the general public not easily finding cars of interest to them. We would like to have a mobile application that meets both these challenges.

Goal

The mobile app shall provide a facility for the members of our organization to sell cars to other members as well as the general public.

Functionalities

- Member registration
- Uploading of cars for sale
- Searching for cars using different criteria
- The application should be able to show map locations of available cars
- Provide various payment mechanisms within the app.
- A facility for potential buyers to contact sellers through Instant messaging and other methods available
- Seller rating
- User friendly interface
- Good compatibility with different platforms.

Roles

We are the product owners, and we would like that you develop this app for us.
