### **Background:**

Gotheburg's City Library is a public place where you can borrow books. With the growing technology and life becoming faster and faster every day, it seems hard and time consuming for people to visit the library, borrow books and carry them around. Having a free online library system can help readers to access the library and borrow books and read them in an easy way. Online City Library should be made available for everyone in the city. The user can search within the books of their interests and have a great time reading them.

### **Goal:**

Gothenburg's City library aims to increase the amount of readers through an online version. The 24/7 library provides opportunity for users to access the library at anytime and anywhere they desire.

### **Functionalities:**

The Online Library system should include the following functionalities:

1. A Login system for the user.
2. An Admin system.
3. A search function.
4. A new arrival section and library news column.
5. The user should be able to rate, like, recommend, share the views and comment.
6. A Security system to prevent users from downloading and copying.
7. The content of the library should be categorised.
8. The system should be available in both Swedish and English.
9. Borrowing system (check availability, borrow, wait in the queue)
10. It should include an information section like Terms and Conditions, FAQ's, Help.
11. Should be scalable on any smart device.
12. A user history page.

### **Role:**

As the management of Gothenburg City Library we would like to act as product owners and want you to develop a requirement specification document for our online system which fulfils the above functionalities.
