

Sports in Gothenburg

Background

We are part of the city council and we are interested in encouraging people to engage in physical activities.

Currently there is no centralized space on the internet to find the different sport organizations in Gothenburg and close areas. It can also be difficult to stay updated on the different sports events organized throughout all the city. It would be interesting to have a way for all the organizations and the citizens to communicate on the same platform.

We also think it is important to help the current and new citizens in town to find the best place for them to practice their favorite activities and we would like to promote the small clubs and associations in town.

Goal

To make all of this possible we are interested in the creation of a mobile application that would make it easy for people to search and filter associations/clubs based on their preferences.

Functionalities

The application should:

- Allow health professional to share their knowledge with other users
- Allow club owners to be present on the application
- Allow users to search through the clubs/events based on different criterias (eg Location, price, schedule, sports...)
- Allow users to set criterias
- Work on all mobile devices
- Provide multilingual support

Roles

We are the product owners and we want you to do the requirement engineering.
